

Is technology helping creativity or destroying it?

Generative AI is taking an important place in the creative jobs, for instance the Suno AI create music from a text, from this it emerges a lot of question like : could technology could help or destroy creativity? First of all, the context must be introduced. According to the jobs, the answer will be slightly different.

A national survey in the USA show that 26% of employees using generative AI improved their creativity, but a professor explains that people who are using AI should use metacognitive processes. He defines it as : Thinking about your thinking, to do organisational works.

But there is a issue with the art based jobs. For now, AI's do not have any consciousness, they are just repeating what they've seen, that's why they don't have any feelings, they copy the feelings. But what if AI release their jobs better than humans? Here is an other issue here, this is because as Humans we value the creations of our pairs, higher as the machine one because, this is not only a concern of quality, this is also a matter of labour, expertise and feelings. That's why some people think that, AI should stay in repetitive works and only should improve efficiency because it is stealing our self thinking.

Finally, AI might help Humans to do boring tasks, but we must keep our self thinking by assigning non human valued tasks to .
